NOTIFICATION DATE		DELIVERY MODE		
06/30/2008		ELECTRONIC		

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Notice of the Office communication was sent electronically on above-indicated "Notification Date" to the following e-mail address(es):

patents@hahnlaw.com  
akron-docket@hotmail.com

<b>Office Action Summary</b>	<b>Application No.</b> 10/674,270	<b>Applicant(s)</b> DE VOIR ET AL.
	<b>Examiner</b> NATHAN H. BROWN JR	<b>Art Unit</b> 2129

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --  
**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE (3) MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED. (35 U.S.C. § 133).

Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

#### Status

1) Responsive to communication(s) filed on 13 March 2008.

2a) This action is FINAL.      2b) This action is non-final.

3) Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

#### Disposition of Claims

4) Claim(s) 1-6 and 8-17 is/are pending in the application.

4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.

5) Claim(s) \_\_\_\_\_ is/are allowed.

6) Claim(s) 1-6 and 8-17 is/are rejected.

7) Claim(s) \_\_\_\_\_ is/are objected to.

8) Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

#### Application Papers

9) The specification is objected to by the Examiner.

10) The drawing(s) filed on \_\_\_\_\_ is/are: a) accepted or b) objected to by the Examiner.  
 Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
 Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).

11) The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

#### Priority under 35 U.S.C. § 119

12) Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).

a) All    b) Some \* c) None of:  
 1. Certified copies of the priority documents have been received.  
 2. Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.  
 3. Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

#### Attachment(s)

1) Notice of References Cited (PTO-892)  
 2) Notice of Draftsperson's Patent Drawing Review (PTO-948)  
 3) Information Disclosure Statement(s) (PTO-166/08)  
 Paper No(s)/Mail Date \_\_\_\_\_

4) Interview Summary (PTO-413)  
 Paper No(s)/Mail Date \_\_\_\_\_

5) Notice of Informal Patent Application  
 6) Other: \_\_\_\_\_

Examiner's Detailed Office Action

1. This Office Action is responsive to the communication for application 10/674,270, filed March 13, 2008.
2. Claims 1-6 and 8-17 are pending. Claims 1 is currently amended. Claims 7 and 18 are cancelled. Claims 2-6, 8-17 are previously presented.
3. After the previous office action, claims 1-6 and 8-17 stood rejected.

Claim Rejections - 35 USC § 112, 1<sup>st</sup>

4. The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

Art Unit: 2129

5. Claims 1-6 and 8-17 are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention. Amended independent claim 1 recites "automatically time-centering" which is not defined in the specification.

#### Claim Rejections - 35 USC § 103

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

5. Claims 1-3 are rejected under 35 U.S.C. 103(a) as being unpatentable over *Esteller et al.* (USPN 6,594,524) in view of *Voelz* (USPN 4,779,100).

Regarding claim 1. (Previously presented) *Esteller et al.* teach an apparatus for the classification of physiological events (see Abstract, Examiner interprets "forecasting" to be a classification task where the input is a description of some earlier event and the output is the identification of some event that follows (or results from) the earlier event.), comprising:

a signal input for the input of a physiological signal representing or constituting a physiological event (see col. 9, lines 34-36); and  
a classification unit (see Fig. 3, item 200 "Intelligent Data Processing Unit") for classifying the physiological signal on the basis of its signal shape (see col. 18, lines 44-50), the classification unit comprising:

a transformation unit which is designed to carry out transformation of the physiological signal in such a way that as the output signal it outputs a number of values representing the physiological signal and based on the transformation (see Fig. 4, preprocessing 210 and feature extraction; col. 9, lines 20-25; col. 20, lines 26-36); and  
a probabilistic neural network which is connected to the transformation unit to

Art Unit: 2129

receive the values (see Fig. 32, col. 36, lines 43-50) and which contains a number of event classes which represent physiological events (see Fig. 32, col. 36, lines 30-33) and which in turn are each represented by a set of comparative values, which probabilistic neural network is adapted on the basis of the comparison of the values with the comparative values to effect an association of the physiological signal represented by the values with one of the event classes (see col. 36, lines 55-56 and col. 37, lines 27-36, *Examiner interprets "weights used at the hidden layer of the PNN" to be comparative values, which the probabilistic neural network is adapted on.*).

*Esteller et al.* do not teach an adjusting unit for centering the physiological signal in a time window of predetermined window width and for outputting the centered physiological signal to the transformation unit, the adjusting unit connected upstream of the transformation unit. However, *Voelz* does teach an adjusting unit for centering the physiological signal in a time window of predetermined window width and for outputting the centered physiological signal to the transformation unit (see Fig. 2 and Abstract, *Examiner interprets "the sensitivity or balance control of each polygraph electronic module"* (see Fig. 2)

Art Unit: 2129

to be an adjusting unit. Examiner interprets the "circuitry having a monostable multivibrator configured as a non-retriggerable one shot device responsive to the voltage change signal from the detector to provide a single pulse driving signal to a pen driving motor" to be the transformation unit.), the adjusting unit connected upstream of the transformation unit (see Abstract, Examiner interprets the "sensitivity or balance potentiometer" and "detector in the form of a differentiator for detecting a change in voltage on the wiper of the sensitivity or balance potentiometer that produces a signal indicative of the voltage change" to be connected upstream of the transformation unit.).

It would have been obvious at the time the invention was made to persons having ordinary skill in the art to combine *Esteller et al.* with *Voelz* to obtain an apparatus capable of indicating a change in the control setting of an instrument.

Regarding claim 2. *Esteller et al.* teaches the apparatus of claim 1, wherein: the transformation unit is adapted for executing .the transformation operation on the basis of wavelets and a transformation rule determining the values to be outputted using the wavelets (see col. 28, lines 21-44).

Regarding claim 3. *Esteller et al.* teaches the apparatus of claim 2, wherein: the comparative values of the probabilistic neural network are based on a transformation procedure in which the same wavelets and the same transformation rule as in the transformation unit are used (see Fig. 32, col. 37, lines 10-17; inputs of the neural network come from the outputs of transformation unit, therefore said comparative values are based on the transformation procedure).

6. Claims 4-6, 8, 9, and 11-17 are rejected under 35 U.S.C. 103(a) as being unpatentable over *Esteller et al.* in view of *Voelz* and further in view of *Echauz et al.* (USPN 6,678,548).

Regarding claims 4, 11, and 12. *Esteller et al.* teaches the apparatus of claim 3, wherein the probabilistic neural network further comprises: at least one ascertaining unit for determining association probabilities of the physiological signal with the event classes on the basis of the comparison of the values with the comparative values of the respective event class and for outputting the ascertained association probabilities (see Fig. 32, col. 37, lines 11-20). *Esteller et*

Art Unit: 2129

al. does not expressly teach selection unit which is connected to the ascertaining unit for receiving the association probabilities and which is adapted to extract the highest association probability from the association probabilities and to associate the physiological signal with the event class having the highest association probability (it is disclosed in Fig. 32 as competitive layer, but without a detailed explanation). However, *Echauz et al.* teaches selection unit which is connected to the ascertaining unit for receiving the association probabilities and which is adapted to extract the highest association probability from the association probabilities and to associate the physiological signal with the event class having the highest association probability (see col. 26, lines 36-39 mention competitive layer as a maximum selector; see also col. 18, lines 53-66). It would have been obvious to a person of ordinary skill in the art at the time of the invention to include the details on implementation of a probabilistic neural network from *Echauz et al.* and combine it with the probabilistic neural network of *Esteller et al.* in order to find the details of how the probability of having a seizure is estimated.

Art Unit: 2129

Regarding claim 5. *Esteller et al.* teaches the apparatus of claim 4, wherein: two or more sets of comparative values representing the same event class are present for at least one event class (see col. 13, lines 39-44).

Regarding claim 6. *Esteller et al.* teaches the apparatus of. claim 5, wherein: the ascertaining unit is adapted to determine a plurality of association probabilities for each event class which has two or more sets of comparative values representing the same event class (see Fig. 32, T values; col. 37, lines 22-26), and the selection unit is so designed that, for those event classes which have two or more sets of comparative values representing the same event class, it forms average values of the corresponding association probabilities and , upon extraction of the highest association probability uses the average values instead of the individual values (see Fig. 32, averaging operation on Ts is shown in circles in the output layer; col. 37, lines 12-20, averaged T1 and T2 form probabilities PI and P2 correspondingly).

Regarding claim 8. *Esteller et al.* do teach the apparatus of claim 6. *Esteller et al.* do not teach the apparatus of claim 6, wherein: in those event classes which include two or more sets

Art Unit: 2129

of comparative values representing the same event class, the sets of comparative values correspond to different offsets in the centering of the centered physiological signal. Voelz does teach that, in those event classes which include two or more sets of comparative values representing the same event class (see Fig. 1 and col. 2, line 66 to col. 3, line 14), the sets of comparative values correspond to different offsets in the centering of the centered physiological signal (see col. 3, lines 15-20, *Examiner interprets adjustments of "the balance or centering on chart 10" to correspond to different offsets in the centering of the centered physiological signal.*). It would have been obvious at the time the invention was made to persons having ordinary skill in the art to combine Esteller et al. with Voelz to obtain an apparatus capable of indicating a change in the control setting of an instrument.

Regarding claim 9. Esteller et al. teaches an implantable medical device characterized in that it is provided with an apparatus for the classification of physiological events as set forth in claim 8 (see Abstract).

Regarding claim 13. Esteller teaches the apparatus of claim 1, wherein: two or more sets of comparative values representing the

Art Unit: 2129

same event class are present for at least one event class (col. 13, lines 39-44).

Regarding claim 14. *Esteller et al.* teaches the apparatus of claim 11, wherein: two or more sets of comparative values representing the same event class are present for at least one event class (see col. 13, lines 32-36, *Examiner interprets "electrical, magnetic, chemical, sensorial or cognitive stimulation variables" to be comparative values representing the same event class are present for at least one event class.*).

Regarding claim 15. *Esteller et al.* teaches the apparatus of claim 12, wherein: two or more sets of comparative values representing the same event class are present for at least one event class (see above).

Regarding claim 16. *Esteller et al.* teaches the apparatus of claim 14, wherein: the ascertaining unit is adapted to determine a plurality of association probabilities for each event class which has two or more sets of comparative values representing the same event class (see Fig. 32, col. 37, lines 21-26, *Examiner interprets the entries of Matrix T to determine a plurality of association probabilities for each event class.*),

Art Unit: 2129

and the selection unit is so designed that, for those event classes which have two or more sets of comparative values representing the same event class, it forms average values of the corresponding association probabilities (see Fig. 32, Examiner interprets the output units  $P_1$  and  $P_2$  to form the average of  $T_{1j}$  and  $T_{2j}$ , respectively, where each  $T_{ij}$  is "the probability that the input signals belong to the pre-seizure/seizure class".) and upon extraction of the highest association probability uses the average values instead of the individual values (see Fig. 32, Examiner interprets the units of the "Competitive Layer" to extract the highest association probability by picking one of  $P_1$  or  $P_2$  which use the average of  $T_{1j}$  and  $T_{2j}$ , respectively.).

Regarding claim 17. Esteller et al. teaches the apparatus of claim 15, wherein: the ascertaining unit is adapted to determine a plurality of association probabilities for each event class which has two or more sets of comparative values representing the same event class (see Fig. 32, col. 37, lines 22-26, Examiner interprets the entries of Matrix T to comprise two or more sets of comparative values representing the same event class (e.g.,  $T_{11}$  and  $T_{21}$  emanate from the same hidden unit, which represents a class of pre-seizure data).), and the

Art Unit: 2129

selection unit is so designed that, for those event classes which have two or more sets of comparative values representing the same event class, it forms average, values of the corresponding association probabilities and upon extraction of the highest association probability uses the average values instead of the individual values (see Fig. 32, Examiner interprets the units of the "Competitive Layer" to extract the highest association probability by picking one of  $P_1$  or  $P_2$  which use the average of  $T_{1j}$  and  $T_{2j}$ , respectively.).

7. Claim 10 is rejected under 35 U.S.C. 103(a) as being unpatentable over *Esteller et al.* in view of *Voelz* and further in view of *Igel et al.* (US Patent No. 6,192,273).

Regarding claim 10. *Esteller et al.* and *Voelz* teach the implantable medical device of claim 9 (see Abstract). *Esteller et al.* and *Voelz* do not teach that the implantable medical device is in the form of a cardiac pacemaker or defibrillator. *Igel et al.* teach that the implantable medical device is in the form of a cardiac pacemaker or defibrillator (see Fig. 1, col. 3, lines 24-34, Examiner interprets "device 10 may optionally comprise a therapy system 70 for delivering electrical shock or pacing impulses" to mean an implantable medical device is in

Art Unit: 2129

*the form of a cardiac pacemaker or defibrillator.). It would have been obvious to a person of ordinary skill in the art, at the time of the invention, to combine the probabilistic neural network classifier from Esteller et al. and Voelz with the implantable device of Igel et al. to obtain a neural network classifier for "adaptively sampling a cardiac electrical signal for use in a heart rhythm classifier" (see Igel et al., col. 2, lines 38-40).*

### Response to Arguments

6. Applicant's arguments filed March 18, 2008 have been fully considered.

#### Rejection of Claims 1-3 Under 35 U.S.C. §103(a)

Applicants argue:

Esteller does not teach or suggest an adjusting unit for automatically time-centering a physiological signal with respect to the time dimension in a time window of predetermined window width in the time dimension as does the claimed invention of claim 1. Furthermore, Voelz does not teach or suggest an adjusting unit for automatically

Art Unit: 2129

time-centering a physiological signal with respect to the time dimension in a time window of predetermined window width in the time dimension as does the claimed invention of claim 1.

Instead, Voelz describes being able to manually adjust either of two potentiometers. The first potentiometer provides adjustment of an amplitude of a signal (sensitivity), and the second potentiometer provides adjustment of a vertical position of the signal on a display (balance). Neither the sensitivity potentiometer nor the balance potentiometer of Voelz provides adjustment in the time dimension. The sensitivity potentiometer provides adjustment of the amplitude of the signal and the balance potentiometer simply allows a user to move the signal vertically up or down on the display. Examples are shown in Fig. 4 of Voelz and described in column 5, lines 38-48. Referring to Fig. 4 of Voelz, the horizontal dimension is the time dimension. No adjustment is made in this horizontal time dimension. Adjustments are only made in the vertical dimension which is an amplitude dimension and a vertical display dimension. The monostable multivibrator of Voelz simply provides a pulse signal which is displayed below the physiological signal to indicate when one of the sensitivity potentiometer or the balance potentiometer has been adjusted. Again, no adjustment in the time dimension is taking place in Voelz. Furthermore, the adjusting of sensitivity (amplitude) and/or balance (vertical display position) of the signal in Voelz is done manually by a user manipulating the potentiometer(s). The claimed subject matter of independent claim 1 automatically time-centers a physiological signal in a time window in the time dimension without any user intervention.

Examiner responds:

Examiner finds no recitation of "automatically time-centering a physiological signal" in Applicants' Specification and thus considers the argument moot. Claims 1-3 remain rejected Under 35 U.S.C. §103(a).

Art Unit: 2129

Applicants argue:

In the current Office action, claims 4-6, 8, 9, and 11-17 are rejected under 35 U.S.C. 103(a) as being unpatentable over Esteller in view of Voelz and further in view of Echauz et al. (US Patent No. 6,678,548), hereinafter Echauz.

Applicants respectfully traverse the foregoing rejections in view of the above pending claims and for reasons set forth hereafter.

As described above, Esteller and Voelz do not teach or suggest an adjusting unit for automatically time-centering a physiological signal with respect to the time dimension in a time window of predetermined window width in the time dimension as does the claimed invention of claim 1. Furthermore, Echauz does not teach or suggest an adjusting unit for automatically time-centering a physiological signal with respect to the time dimension in a time window of predetermined window width in the time dimension as does the claimed invention of claim 1.

Therefore, in view of at least the foregoing and the fact that claims 4-6, 8, 9, and 11-17 depend either directly or indirectly from independent claim 1, it is respectfully submitted that claims 4-6, 8, 9, and 11-17 define allowable subject matter as well. Applicants respectfully request that the rejection of claims 4-6, 8, 9, and 11-17 under 35 U.S.C. 103(a) be removed.

Examiner responds:

Examiner finds no recitation of "automatically time-centering a physiological signal" in Applicants' Specification and therefore considers the argument moot. Claims 4-6, 8, 9, and 11-17 remain rejected Under 35 U.S.C. §103(a).

### Conclusion

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL.** See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.
